Additional

Clear float

Quickly and easily clear floated content within a container by adding a clearfix utility.

Easily clear floats by adding `.clear` (also `.clear-fix` , `.clearfix` or `.clear-float`) to the parent element.

```
<div class="clear">...</div>
```

The following example shows how the clear can be used. Without the clear the wrapping div would not span around the buttons which would cause a broken layout.

Button floated left

Button floated right

```
<div class="clear">  
  <button class="button place-left">Button floated left</button>  
  <button class="button place-right">Button floated right</button>  
</div>
```
