Additional

Tabs

Metro 4 has at its disposal classes and a plugin for creating an tabbed interface.

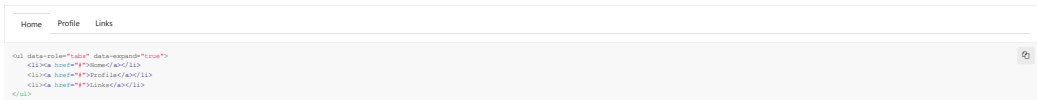

Horizontal

To create horizontal tabs add class `tab` to list and attribute `data-role="tab"`. To set tabs on bottom add class `bottom`.

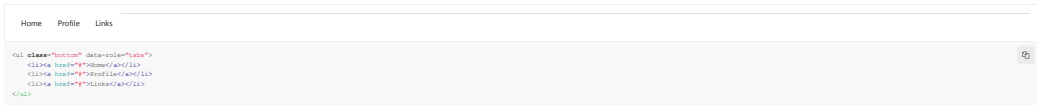

Default tabs is `collapsible`.

To expand add one of media point to attribute `data-expand="true"` or `data-expand-point="false|middle|end"`.

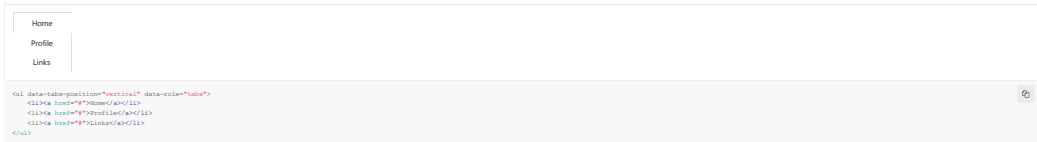

You can create tabs with bottom orientation. To create it add attribute `data-tab-position="bottom"`.

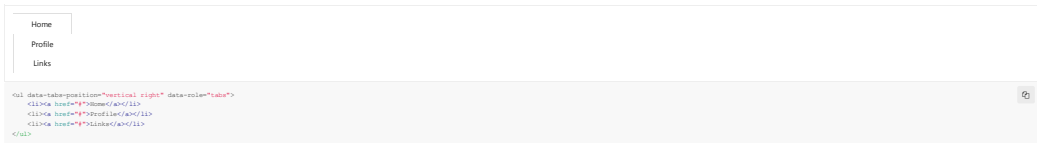

Vertical

To create vertical tabs add attribute `data-tab-position="vertical"`. To set tabs on right add attribute `data-tab-position="vertical right"`.

Left side

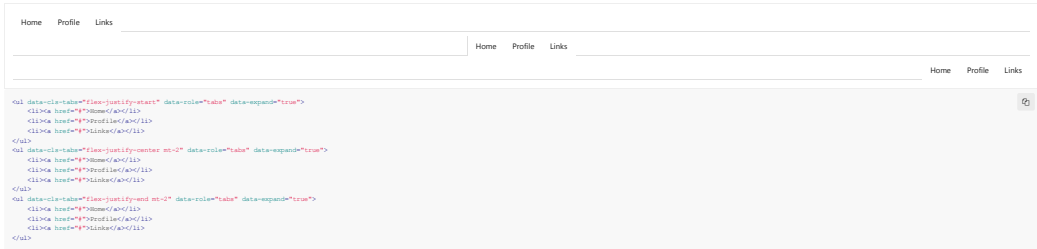

Right side

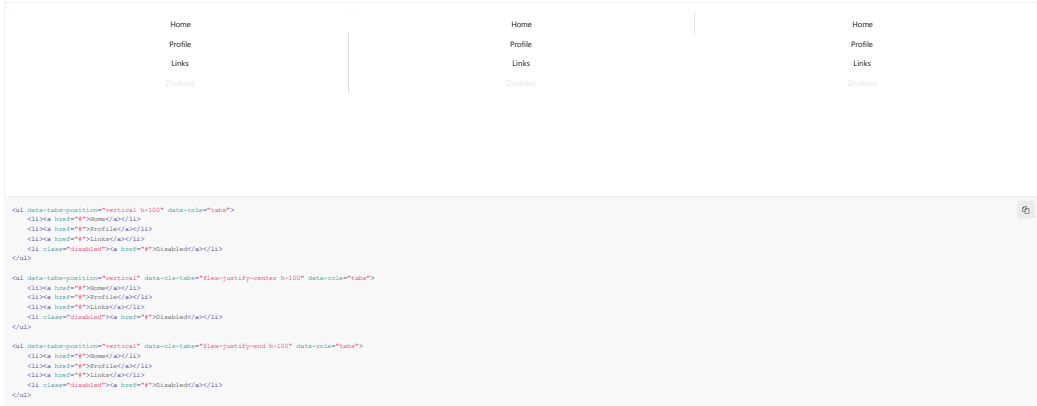

Alignment

Use flex utilitarian classes to determine the position of tabs: `.flex-justify` with attribute `data-cis="tab"`.

Horizontal tabs alignment

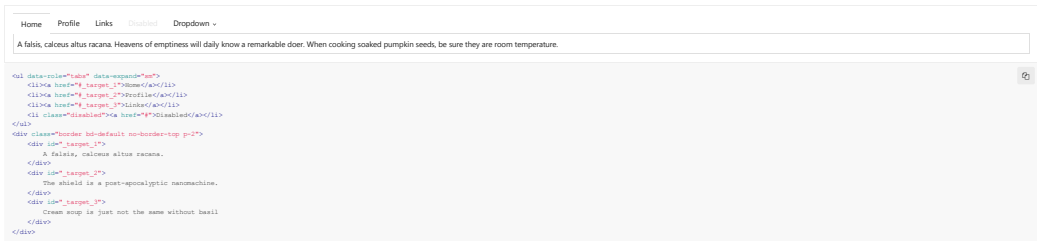

Vertical tabs alignment

Target content

Target content is determined automatically through the attribute `href`. If attribute `href` have a valid formed url address, then tab works as `anchor`.

Events

Plugin activated automatically when you add attribute `data-role="tab"` to list. You can define callbacks for events: `onTabCreate`, over attribute `data-on-tab-create`, `onTab`, over attribute `data-on-tab` and `onBeforeTab` for `onBeforeTab`.

| Events | Data * | Desc |
|-------------------------------------|---------------------------------|---|
| <code>onBeforeTab(tab, elem)</code> | <code>data-on-before-tab</code> | This event occurs before the tab is opened if this function return false, tab is not open |
| <code>onTab(tab, elem)</code> | <code>data-on-tab</code> | This event occurs when the tab is opened |
| <code>onTabCreate(tab, elem)</code> | <code>data-on-tab-create</code> | This event occurs when the tabs is created |

Custom classes

You can add your custom classes to any element of tabs component. To add classes, use attributes: `data-cis="tab"`, `data-cis="tab-list"`, `data-cis="tab-list-item"`

Additional tab types

From Metro 4 ver 4.2.29 you can set additional tab types for horizontal expanded tabs. To set it, use attribute `data-tab-type="..."`. You can use next values for this attributes: `text`, `group`, `pill`.

Text

- Table
