# Float

Toggle floats on any element, across any breakpoint, using our responsive float utilities.

## Overview

These utility classes float an element to the left or right, or disable floating, based on the current viewport size using the CSS `float` property. `!important` is included to avoid specificity issues. These use the same viewport breakpoints as our grid system.

To change floating add one of classes: `.float-left`, `.float-right`, `.float-none`, and synonyms: `.place-left`, `.place-right`, `.place-none`.

Float left on all viewport sizes

Float right on all viewport sizes

Don't float on all viewport sizes

```
<div class="float-left">Float left on all viewport sizes</div>
<div class="float-right">Float right on all viewport sizes</div>
<div class="float-none">Don't float on all viewport sizes</div>
```

## Responsive

All float utilities classes has media variants with breakpoints suffixes: `-sm`, `-md`, `-lg`, `-xl`, `-xxl`.

Floating box

```
<div class="float-left-lg float-right-md">...</div>
```
