Session storage About storage Store data Get data

Delete data

# Session storage

Metro 4 provides special object to work with browser session storage engine.

#### About

Object for work with session storage defined in Metro.session and contains next methods:

- setKey(key) define main storage key (default: "METRO:APP")
- setKey() get main storage key
- setItem(key, value) store any data to key
- getItem(key, default) get stored values with key.
- getItemPart(key, sub\_key, default) get part of stored values with key.
- delitem(key) delete data with key.

### Init storage

To init storage execute method setXey . This method sets key for your app data in storage. This is a prefix for all your stored data. Method getXey return main key.

```
{\tt Metro.session.setKey('MY\_APP');}
                                                                                                                                     đ
Metro.session.getKey();
```

#### Store data

To store data in storage execute method setItem .

```
var key = 'user',
                                                                                                                           4
       'Bill': {
            'FirstName': 'Billy',
            'LastName': 'Gates
            'Company': 'Microsoft'
        'Steve': {
            'FirstName': 'Steve',
            'Company': 'Apple'
Metro.session.setItem(key, data);
```

#### Get data

To get data you can use methods: getItem or getItemPart . Method getItem return data stored with key . Method getItemPart return part of data stored with key .

#### getItem

This method have next parameters: key - key for stored data, default - value returned if key not exist in storage

```
var key = 'user',
                                                                                                                        4
   default_value = {};
Metro.session.getItem(key, default_value);
```

## getItemPart

This method have next parameters:  $_{\text{key}}$  - key for stored data,  $_{\text{sub\_key}}$  - subkey for stored data,  $_{\text{default}}$  - value returned if key not exist in

```
var key = 'user',
                                                                                                                                     4
    subkey = 'Bill',
subkey2 = 'Bill->LastName',
    default_value = {};
Metro.session.getItemPart(key, subkey, default value);
Metro.session.getItemPart(key, subkey2, default_value);
```

#### Delete data

To delete data you can use method delItem .

```
var key = 'user';
                                                                                                                        4
Metro.session.delItem(key);
```
