# Flip Card

Use builtin animation for your object to create flip card animation.

About

To create `flip-card` animation you must create container with class `flip-card` and add two inner blocks with classes `.front` and `.back`. Also you must define size for `flip-card` : `height` and `width`

```
<div class="flip-card" style="height: 340px; width: 480px">
    <div class="front"></div>
    <div class="back"></div>
</div>
```

Flip the cards

Back

Back

Activation effect

To activation `flip-card` effect, you must add one of two subclasses:

- `.effect-on-hover` - card flipped on user hover cursor on the card
- `.effect-on-active` - card flipped on toggle class `.active` on card

effect-on-hover

```
<div class="flip-card effect-on-hover">
    <div class="front"></div>
    <div class="back"></div>
</div>
```

effect-on-active

```
<div class="flip-card effect-on-active">
    <div class="front"></div>
    <div class="back"></div>
</div>
```

Horizontal flip

By default, card flipped in vertical plane. To flip card in horizontal plane, add subclass `.flip-horizontal` to card.

```
<div class="flip-card effect-on-hover flip-horizontal">
    <div class="front"></div>
    <div class="back"></div>
</div>
```
